Derwent Abstract: (DE19721673A) The device has semiconducting elements as light sources, esp. LEDs arranged in clusters, enabling illumination in white or signal colours such as red, green blue or yellow. Each cluster is a replaceable unit, pref. in cartridge form.
The individual clusters or cartridges are moulded or injected, esp. using recyclable plastics which are good thermal conductors and resistant to pressure. The clusters or cartridges can be parts of a redundant operating system. The white light can be produced by mixing different colours using corresp. radiating special semiconductors.
USE/Advantage - Also for obstructions or warning systems. Improved control characteristics, esp. w.r.t. overshoot after step change in demand or maximum error after step noise value change.
